

Fiscal Year 2017 REDI Community & Innovative Projects Cost-Share Application

INSTRUCTIONS FOR USE OF THIS FORM:

This form is designed to assist in submitting a complete application for consideration by the St. Johns River Water Management District (SJRWMD) for the REDI Community & Innovative Projects Cost-Share Program. Detailed guidance on completing this application can be found in the Funding Guidance Document. All sections of the form must be completed to be considered a complete application. If additional space is needed to fully complete a section, please attach separately.

PROJECT CATEGORY (select only one):		<input type="checkbox"/> REDI	<input checked="" type="checkbox"/> Innovative
A. BASIC INFORMATION			
A-1	PROJECT NAME: Suburban Heights - Beville Creek Restoration		
A-2	Applicant		
	Name/title: Elizabeth Waite, P.E./ City of Gainesville Public Works Department Project Manager		
	Email address: waiteed@cityofgainesville.org		
	Mailing address: 405 NW 39 th Avenue, Gainesville, FL 32609		
	Office Phone: (352) 393-8405	Mobile Phone: (802) 282-3490	
A-3	Contact (if other than applicant)		
	Name/title:		
	Email address:		
	Mailing address:		
	Office Phone: ()	Mobile Phone: ()	
A-4	What County is this project located?		
	<input checked="" type="checkbox"/> Alachua	<input type="checkbox"/> Baker	<input type="checkbox"/> Bradford
	<input type="checkbox"/> Flagler	<input type="checkbox"/> Indian River	<input type="checkbox"/> Lake
	<input type="checkbox"/> Osceola	<input type="checkbox"/> Putnam	<input type="checkbox"/> Seminole
	<input type="checkbox"/> Brevard	<input type="checkbox"/> Clay	<input type="checkbox"/> Duval
	<input type="checkbox"/> Marion	<input type="checkbox"/> Nassau	<input type="checkbox"/> Orange
	<input type="checkbox"/> St. Johns	<input type="checkbox"/> Okeechobee	<input type="checkbox"/> Volusia
A-5	What Water Supply Planning Region is this project located <i>(Refer to map at http://www.sjrwmd.com/watersupply/planning.html)</i>		
	<input checked="" type="checkbox"/> North Florida (North Florida Regional Water Supply Partnership/North Florida Water Initiative)		
	<input type="checkbox"/> Central Springs and East Coast		
	<input type="checkbox"/> Central Florida (Central Florida Water Initiative)		
A-6	Is the Applicant a Rural Economic Development Initiative (REDI) Community? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No		
	If yes, please attach a signed Waiver of Matching Funds Letter on your letterhead. See format at sjrwmd.com/funding/REDI.html		

B. PROJECT INFORMATION	
B-1	<p>PROJECT TYPE <i>Check only one and provide evidence in Section B-3.</i></p> <p> <input type="checkbox"/> Water Supply <input type="checkbox"/> Water Conservation <input type="checkbox"/> Water Quality <input type="checkbox"/> Flood Protection <input checked="" type="checkbox"/> Natural Systems </p>
B-2	<p>PROJECT DESCRIPTION (<i>Scoring Criterion #1</i>)</p> <p>a. Short Description <i>Succinctly (four sentences or less) describe the project, e.g. what is being constructed or what is the program to be implemented?</i></p> <p>A 1000' long creek restoration project that utilizes Regenerative Stormwater Conveyances (RSC) principals in conjunction with Biosorption Activated Media (BAM) to reduce erosive conditions, improve water quality, promote groundwater recharge, and enhance the ecological and biodiversity within Beville Creek. This natural systems improvement will also maintain a wildlife corridor between Cofrin Nature Park to Kingswood Lake while simultaneously providing erosion protection and an aesthetically pleasing creek system to benefit both the local residents and the environment. Removal of invasive species and installing native plantings will serve to both stabilize creek banks and lessen the maintenance burden on the city's operations and maintenance department, promoting the sustainability goals of the City. The RSC step pools create micro waterfall structures which isolate erosive forces within an armored riprap and boulder section that stabilizes the creek and helps to prevent sediment from moving downstream.</p> <p>b. Innovative Potential (<i>N/A for REDI Projects</i>) <i>Describe why this project is innovative. Refer to the guidance document for further instruction. Attach separate pages if necessary.</i></p> <p><u>Project Innovative Components:</u></p> <ol style="list-style-type: none"> 1. Use of RSC, a new low impact design (LID) that uses a natural systems approach to stormwater management and includes a series of shallow aquatic step pools, riffle grade controls and native vegetation to stabilize and enhance open surface water systems. RSC systems mitigate the damage of excessive stormwater discharge by transitioning surface water flow to groundwater seepage and exfiltration into parent soils. 2. The proposed system maintains the open, natural state of the creek instead of enclosing the system in a conventional piped, conduit flow system that would reduce both groundwater recharge as well as any water quality and ecological benefits of an open and natural system. 3. Maintains and enhances the natural ecosystem and biodiversity of Beville Creek by incorporating native plantings and by removing exotic species. 4. Proposed to include Bold and Gold™ BAM developed by UCF, to enhance water quality of the system. RSC systems have been demonstrated to reduce TSS, TP, and TN in surface flow by 72%, 28%, and 30%, respectively without the use of BAM (see references in section B-3). Incorporating BAM into the RSC step pool system will further remove TN and TP from the groundwater seepage that will occur as a result of seepage through the step pools. This type of RSC application with BAM would be, to our knowledge, the first of its kind in the State.

c. Measures of Success

Describe how will you measure the effectiveness of your project?

Success will be measured by a variety of system metrics, including the following:

1. **Long-term erosion protection.** The primary function of the system is to prevent ongoing erosion of Beville Creek, that is currently discharging high amounts of sediment loading into Cofrin Nature Park, immediately downstream of the project, as well as threatening several homeowner’s properties from erosion-related damage. The long-term stability of the Creek will be monitored by City staff.
2. **Ecological benefits.** Native plantings and groundcover will provide habitat for Florida species. The survival rate of various native plantings will be monitored by City staff and replaced as necessary to promote a well-established vegetated Creek system.
3. **Maintenance reduction.** Routine maintenance of the Creek system by City staff will be documented over the years to determine if the Creek system requires a reduced maintenance effort from the existing system.
4. **Water Quality.** Periodic water quality monitoring of Beville Creek (downstream of project site) has been performed by Alachua County EPD, including sampling for Fecal Coliform, E.Coli, Dissolved Oxygen, Alkalinity, Chloride, Sulfate, Organic Carbon, Metals, Ammonia Nitrogen, NOx, Total Nitrogen, TKN, ortho phosphorus, soluble reactive phosphate, Total Phosphorus, Color, turbidity, specific conductance, pH, TDS, TSS and temperature. Post-construction water quality samples will be measured against historical information to determine if any water quality improvements are evident as a result of the project.

d. Is this project multi-phased or part of a larger overall effort? If so, describe the larger project.

No, this project is not multi-phased. If this project proves successful the design principles incorporated in this project will be used in subsequent creek restorations in Gainesville but no specific projects have been identified at this time.

e. Describe the location, include a map. The map should identify any potentially affected MFL, TMDL, BMAP, or impaired water bodies, or affected wetlands or springs.

The Suburban Heights – Beville Creek Restoration project (Project) area is within the Suburban Heights subdivision within the City of Gainesville within Section 34 of Township 09 South, Range 19 East. The study area is located within the jurisdiction of the St. Johns River Water Management District (SJRWMD), and within the Beville Creek Basin (part of the Orange Creek Watershed) of Alachua County. Please see the attached Exhibit A – Project Maps for maps depicting the project vicinity and site infrastructure.

B-3

BENEFITS TO DISTRICT MISSIONS (Scoring Criterion #2)

Describe the benefit to one (or more) of the District's main missions (Water Supply/Conservation, Water Quality, Flood Protection and/or Natural Systems). Indicate which is the primary mission benefit. Attach separate pages if necessary.

Natural Systems Mission (Primary):

The primary mission of this project is to restore a 1000 linear feet segment of Beville Creek as an open, natural system. The Creek was modified around the 1950's to accommodate the residential development around it and now serves primarily as a stormwater drainage conveyance system. The existing Creek has experienced significant erosion due to large volumes of stormwater traveling at high velocities during storm events, which is typical of a channelized creek system within a developed environment. This channelization and urbanization has caused a reduced natural system function to Beville Creek, as well as to release excess sediment and pollutants into sensitive ecosystems downstream, including Cofrin Nature Park.

This Project aims to construct an open 'natural system' Creek restoration improvement that addresses the ongoing erosion issues of Beville Creek. The removal of invasive species and the planting of native Florida and Florida friendly aquatic and groundcover plants will enhance the Creek ecosystem and biodiversity, while preserving a wildlife corridor that exists between Cofrin Nature Park to the South and Kingswood Lake to the northwest.

Water Quality Mission (Secondary):

Beville Creek lies within a TMDL of Hogtown Creek, which is impaired for excess fecal coliforms. Because the improvements incorporate Regenerative Stormwater Conveyance (RSC) systems which promote increased groundwater seepage and reduced surface flow, a reduction of fecal coliforms discharges is expected as a result of this project.

Additional water quality treatment via the incorporation of BAM will help to remove nutrient loading from the groundwater seepage that the RSC system will generate. Note in the construction cost sheet included with this submittal, that the incorporation of BAM into the RSC step pools is a minor cost to the project overall, yet provides a significant amount of the nutrient reduction credit that this project will produce. This demonstrates the benefit of incorporating BAM wherever infiltration-based best management practices (BMPs) are proposed as a low-cost water quality enhancement.

Water Conservation (Secondary):

Water conservation of approximately 2.51 acre-feet per year will be generated for this project by the construction of the RSC step pool system. The step pools act as small retention devices that promote infiltration of surface water flow into groundwater seepage.

b. Local Government / Public Support: *Describe the public support for your project (meetings attended, community workshops, presentations to councils, notification in newsletters, etc.). If your project requires participation from certain communities or homeowners, provide a description of methods used to ensure participation in your project. Provide the rate of participation that can be documented at the time of the application.*

Public involvement has been very high on this project. Two public meetings have been held so far, one at 15% plans with 10 attendees and one at 90% plans with nearly 20 citizens from the neighborhood in attendance. Multiple on site meetings with residents along the drainage corridor have taken place throughout the design phase. Meetings between the Public Works Director and citizens who live along the corridor have also taken place. These meetings have helped to create a design that accommodates all resident's needs. Public meeting were advertised through physical mailings to residents along the corridor, Facebook announcements, announcements in the Gainesville Sun, the Neighbored HOA email distribution list as well as outreach through both the City of Gainesville's Website and the Public Works' Website. I have met with the Suburban Heights Neighborhood Association on two occasions to provide updates between public meetings. Updates are posted periodically on the City of Gainesville's Public Works project webpage which can be viewed at: <http://www.gainesvillepublicworks.org/projects-2/suburban-heights-stormwater-improvements/>.

Citizens in this neighborhood tend to be very active in the community and public outreach across multiple platforms has proven successful. I have personally met with over half of the residents who live along the creek segment that will be restored as part of this project. I have spoken on the phone with many of the others residents along the creek. All residents directly impacted by this project have received project information, with about 75% directly participating via phone calls, email, on site meetings, public meetings or HOA meetings.

The City of Gainesville Public Works Department has also worked in collaboration with the Parks Recreation and Cultural Affairs department as well as the City's Environmentalist to help create a design that supports the ecological and biodiversity of Beville Creek.

c. Past Performance (Scoring Criterion #4): *Identify cost-share projects your organization completed with the District, or projects still underway (explain status) funded in part with District support. Please note: applicants will not be penalized if they have not had previous cost-share projects with the District.*

Please see below for the City of Gainesville's previous SJRWMD Cost Share Agreements:

St Johns River Water Management District Cost Share Agreements

Contract Number	Title	Contract Date	City Share	District Share	Last Invoice
SI438AA	Depot Park Stormwater Treatment	4/13/2005	\$ 60,000	\$ 350,000	6/8/2009
SH437AA	Depot Park-Phase I: West Ponds and Discharge Project	4/16/2004	\$ 715,500	\$ 715,500	6/5/2006
SK915AA	Paynes Prairie Treatment Wetland	7/1/2007	\$ 425,000	\$ 850,000	9/29/2010

C. PROJECT COST INFORMATION

C-1	a. Breakdown of project cost <i>(provide details in separate attachment)</i> <i>Attach a table or spreadsheet with detailed project costs for each task or segment of the project. The District will contribute only to the construction costs of the project. Indicate at the conclusion of the table/spreadsheet, a cost effectiveness evaluation as described below.</i>		
	Please see attached Exhibit C; Construction Cost Estimate		
	b. Cost-share request funding table <i>The District's share (C) cannot exceed 50% of the total construction cost (B) except for REDI communities that have submitted a waiver, up to 100% of total construction cost can be reimbursed.</i>		
	A. Total estimated project cost: (includes capital, construction, land acquisition, planning, permitting & design costs)	\$ 794,339	
	B. Construction costs:	Year 1 (FY2017) \$ 599,509.00	Year 2 (FY2018) \$
	C. Cost-share amount requested:	\$ 299,754.50	
D. Estimated Applicant's Annual Operation & Maintenance Costs:	\$ 1000		
E. Estimated Service life of components:	50 years		

	<p>c. Funding Sources: <i>Identify any other outside sources of funding including State or Federal appropriations or grant monies, municipal bonds. Identify source and status of applicant funding.</i></p> <p>N/A – all funding is from the City’s SMU fund</p> <p>d. Project partners: <i>Check one below and if multi-jurisdictional include the percent of funding to be contributed by each partner.</i></p> <p><input checked="" type="checkbox"/> Single entity</p> <p><input type="checkbox"/> Multi-jurisdictional (attach copy of partnership agreement or memorandum of understanding, if available, and includes status of agreement). Identify other partners:</p>	
<p>C-2</p>	<p>Quantification of Project Benefits</p> <p>For Water Quality Projects: <u>29.24</u> Lbs/year TN removed/reduced annually <u>4.88</u> Lbs/year TP removed/reduced annually</p> <p>For Water Supply/Conservation Projects: <u>2.51 acre-feet/year of water conserved by groundwater seepage (0.00224 MGD)</u></p>	<p>For Flood Protection projects: ____ Acres protected from flooding Annual Exceedance probability - As is: ____/____ years After implementation: ____/____ years</p> <p>For Natural Systems projects: <u>N/A</u> Acres Wetlands Restored/Enhanced <u>1</u> Acres Uplands Restored/Enhanced (1,000 linear feet of Creek restoration)</p>
<p>C-3</p>	<p>Cost Effectiveness (Scoring Criterion #5) (complete for all that apply) <i>For Water Supply and Water Conservation projects, and for Water Quality projects, please attach the Cost Effectiveness Calculator (as provided at http://www.sjrwm.com/funding/REDI.html) and appropriate supporting documentation. (Failure to use the cost effectiveness calculator may result in a zero score for cost effectiveness.) For Water Quality, Flood Protection, and Natural Systems projects, please provide methodology used and additional supporting documentation, including, for Water Supply and Water Quality projects, the cost effectiveness calculator.</i></p> <p>Water Supply: <u>N/A</u> cost per 1000 gallons made available</p> <p>Water Conservation: <u>\$39.87</u> cost per 1000 gallons conserved</p> <p>Water Quality (TP or TN): <u>\$1,115.22</u> cost per lb TN <u>\$6,682.19</u> cost per lb TP</p> <p>Flood Protection: <u>N/A</u> Benefit/Cost ratio</p> <p>Natural Systems: <u>\$32.61</u> cost per linear feet shoreline</p>	
<p>Provide the required attachments: project map, construction schedule/timeline, project cost table or spreadsheet, and cost effectiveness calculator; plus, additional information required for your specific project type in accordance with the District’s 2017 REDI Community& Innovative Projects Cost-Share (RCIPCS) Funding Program Guidance.</p>

CATCHMENTS AND TREATMENT SUMMARY RESULTS

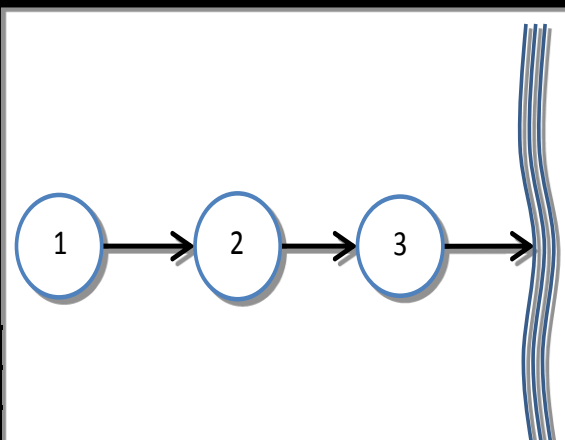

V 8.0

CALCULATION METHODS:

1. The effectiveness of each BMP in a single catchment is converted to an equivalent capture volume.
2. Certain BMP treatment train combinations have not been evaluated and in practice they are at this time not used, an example is a greenroof following a tree well.
3. Wet detention is last when used in a single catchment with other BMPs, except when followed by filtration

NOTE FOR TREATMENT EFFICIENCY GRAPH:

The purpose of this graph is to help illustrate the treatment efficiency of the system as the function of retention depth. The graph illustrates that there is a point of diminished return as the retention depth is substantially increased. Therefore, to provide the most economical BMP treatment system, other alternatives such as "treatment trains" and compensatory treatment should be considered.

Total Phosphorus removal required:	TBD	TBD	TBD	TBD	%
Total Nitrogen removal efficiency:	0.000	0.000	0.000	0.000	%
Total Phosphorous removal efficiency:	0.000	0.000	0.000	0.000	%
Is the wet detention sufficient:					
Average annual runoff volume:	66.662	9.686	21.774		ac-ft/yr
* pond coverage must follow Regulatory Requirements					
Wet Detention Pond Characteristic:					
Minimum Pond Permanent Pool Volume:					ac-ft

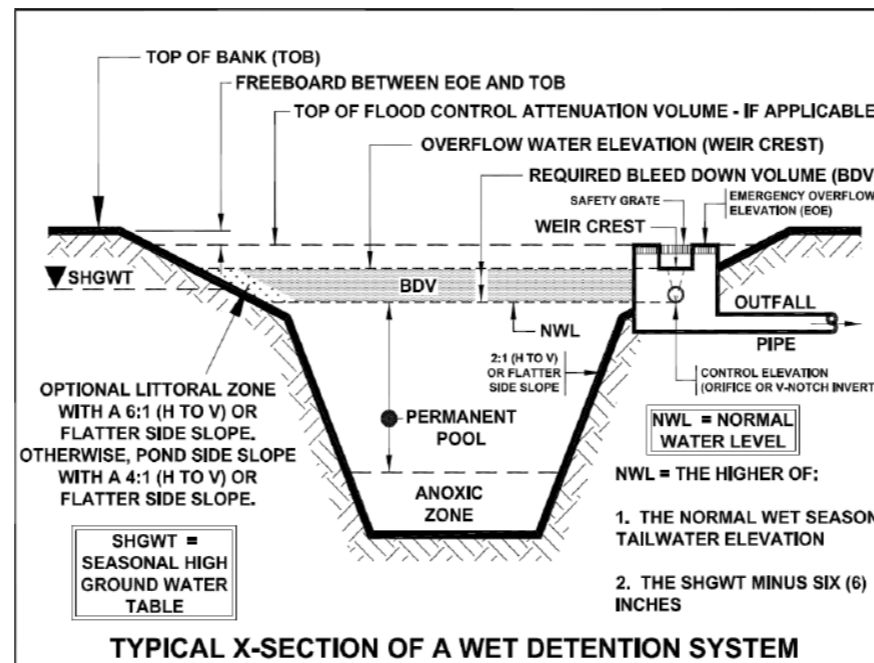

NOTE FOR TREATMENT EFFICIENCY GRAPH:

The purpose of the treatment efficiency graphs is to help illustrate the treatment efficiency of the wet detention system as the function of average annual residence time (and permanent pool volume). The graph illustrates that there is a point of diminished return as the permanent pool volume is substantially increased. Therefore, to provide the most economical BMP treatment system, other alternatives such as "treatment trains" and compensatory treatment should be considered.

Blue Numbers =	Input data
Red Numbers =	Calculated or Carryover

GO TO STORMWATER TREATMENT ANALYSIS

REQUIRED REMAINING TREATMENT EFFICIENCIES OF TREATMENT SYSTEM IN SERIES WITH FLOATING ISLANDS WITH WET DETENTION. USE FOR SIZING OF TREATMENT SYSTEM IN SERIES WITH FLOATING ISLANDS WITH WET DETENTION.

TYPICAL X-SECTION OF A WET DETENTION SYSTEM
