

Well-planned sustainable biomass power plants, using forest debris are a viable source of clean renewable electricity, and thus are helpful for the task of phasing out coal-fired power plants.

Knee-jerk opposition to all biomass projects has no sound scientific basis and is harmful to attempts to stabilize climate for the sake of our children, grandchildren, and future generations. In my opinion, the proposed 100MW Gainesville Renewable Energy Corporation deserves support and is a useful step toward the essential task of phasing out coal emissions.
